

Initial Product Backlog for Scrum Project

Business Case: Online Summer Course Registration System

Product Overview

The product is an online course registration system for summer course offerings. The system allows students and instructors to log in, search for summer course sections, manage course enrollment, and view course-related information. Students can search for available course sections and enroll in eligible sections. Instructors can view the sections they are teaching and access enrollment information for those sections.

Key Stakeholders and Users

The key stakeholders and users of this product include students, instructors, academic departments, and university administrators. Students use the system to search for and enroll in summer course sections. Instructors use the system to view their assigned teaching sections and student enrollment lists. Departments and university administrators benefit from accurate course, section, instructor, and enrollment information.

Initial Product Backlog

ID	User Story	Description	Priority	Priority Justification	Acceptance Criterion
1	As a student, I want to log in to the course registration system in order to securely access my course registration information.	Students need secure access before they can search for courses, view enrollment information, or register for course sections.	High	Student login is foundational because students cannot use registration features unless they can first access the system securely.	Given a student has valid login credentials, when the student enters those credentials, then the system allows the student to access their account.
2	As a student, I want to search for summer course sections by course number in order to find a specific class I need to take.	Students should be able to search for a course such as INFO 465 and view the available summer sections for that course.	High	Searching by course number provides major stakeholder value because students often know the exact course they need for their degree.	Given a student enters a valid course number, when the search is submitted, then the system displays all available summer sections for that course.

3	As a student, I want to enroll in an available course section in order to register for a summer class.	Students should be able to select a course section and enroll if the section has not reached its maximum student limit and the student is not already enrolled in another section of the same course.	High	Enrollment is the core business function of the product because the system's main purpose is to allow students to register for courses.	Given a student selects an open course section, when the student confirms enrollment, then the system enrolls the student and adds the section to the student's schedule.
4	As a student, I want the system to prevent me from enrolling in two sections of the same course in order to avoid duplicate registration errors.	The system should verify whether a student is already enrolled in another section of the same course before allowing enrollment.	Medium	This functionality is important because the case study specifically states that students cannot register for multiple sections of the same course. However, it depends on the core enrollment functionality being implemented first.	Given a student is already enrolled in one section of a course, when the student attempts to enroll in another section of the same course, then the system prevents enrollment and displays an error message.
5	As a student, I want to see whether a course section is full in order to know if I	The system should compare the number of enrolled students with	Medium	This feature provides value because students need to know	Given a course section has reached its maximum enrollment, when a student views the

	can still enroll.	the maximum enrollment allowed for each course section.		whether seats are available before attempting to register, but it depends on the basic enrollment process.	course section, then the system displays that the section is closed or full.
6	As a student, I want to view the classes I am enrolled in in order to confirm my summer schedule.	The system should allow students to view all course sections in which they are currently enrolled.	Medium	This feature is important because students need to verify their schedules after registration, but it relies on the login and enrollment features being completed first.	Given a student is logged in and enrolled in one or more course sections, when the student opens the enrolled classes page, then the system displays all registered course sections.
7	As a student, I want to search for summer classes by department in order to explore courses offered by a specific academic area.	Students should be able to filter summer course offerings by department, such as Information Systems or another department.	Medium	Searching by department improves usability and helps students explore options, but exact course search and enrollment are more central to the initial product.	Given a student selects a department, when the search is submitted, then the system displays summer course sections offered by that department.
8	As a student, I want to search for summer classes by	Students should be able to enter or select an	Medium	This adds value for students who prefer a specific	Given a student search by instructor, when matching

	instructors in order to find sections taught by a specific professor.	instructor and view the course sections assigned to that instructor.		instructor, but it is less essential than basic course search and enrollment.	instructor records exist, then the system displays the summer course sections taught by that instructor.
9	As an instructor, I want to log in to the course registration system in order to view information about the sections I am teaching.	Instructors need secure access to view assigned course sections and student enrollment information.	Medium	Instructor login is important because instructors are a key user group, but student registration features have slightly higher priority.	Given an instructor has valid login credentials, when the instructor logs in, then the system allows the instructor to access instructor-specific course information.
10	As an instructor, I want to view the course sections I am teaching in order to prepare for my summer classes.	Instructors should be able to see their assigned course sections, including course number, section number, modality, and department.	Low	This supports instructor planning, but it is less urgent than student search and enrollment features for the initial backlog.	Given an instructor is logged in, when the instructor opens their teaching schedule, then the system displays all summer course sections assigned to that instructor.
11	As an instructor, I want to view the names of students enrolled in my section in order to know who is registered for the class.	Instructors should be able to access a roster showing the students enrolled in a specific course section.	Low	This feature is useful for instructors and reporting, but it is less urgent than enabling students to search for and enroll in course sections.	Given an instructor selects one of their assigned sections, when the roster is opened, then the system displays the names of students enrolled in that section.
12	As a student, I want to view course details such as credit hours, REAL designation, prerequisites, and modality in order to make an informed	Course and section details should be displayed so students understand what the course offers and whether it fits	Low	This improves decision-making, but the system can still support basic registration with course number, section number, and	Given a student opens a course section, when course details are available, then the system displays credit hours, REAL designation, prerequisites, and

Priority Summary

The backlog uses only the required priority categories: High, Medium, and Low. The priorities follow a balanced distribution with 3 High-priority stories, 6 Medium-priority stories, and 3 Low-priority stories. High-priority stories focus on foundational access, course search, and enrollment because these features provide the core value of the course registration system. Medium-priority stories support important registration rules, enrollment visibility, schedule viewing, search filters, and instructor access. Low-priority stories add useful but less urgent instructor reporting and course detail features. This distribution keeps the backlog balanced while prioritizing the highest-value and most foundational functionality first.

Team Contribution Statement

We, the undersigned team members, state that all team members were actively involved and contributed to the creation of this initial product backlog. Each team member helped review the user stories, descriptions, priorities, priority justifications, and acceptance criteria to ensure the final submission met the assignment requirements.
